

Automation One SEO, AEO, Performance & Domain Migration Report

<https://automationone.org>

<https://automationone.ca> (current WordPress site)

Report date: June 04, 2026

Includes: live audit of automationone.org (Netlify static site), comparison with automationone.ca (WordPress), short-URL plan for long product filenames, and phased migration plan (.ca primary, .org eventually 301 to .ca).

Executive Summary

The **new Netlify site** (automationone.org) is stronger on speed, catalogue page weight, on-page structure, FAQ/AEO scaffolding, and unique product metadata. The **current .ca site** (WordPress + Yoast) still has more indexed URLs (198 product pages, 51 blog posts) and established search history. A smooth shutdown of WordPress requires a **redirect map**, **short public URLs** for long .html product paths, and making **automationone.ca** the canonical domain before redirecting .org to .ca.

Category	Score	Notes
New site (.org) overall readiness	78	Live on Netlify; footers/nav/products UX updated June 2026
Old site (.ca) SEO maturity	68	WordPress still on many URLs; products page still ~1.2 MB
New vs old performance	88	Products page ~4x smaller on .org (live check June 2026)
Migration readiness	58	Short product URLs done; WordPress 301 map + .ca DNS still needed

Website Comparison: automationone.ca vs automationone.org

Live measurements from June 2026. .ca runs WordPress behind Cloudflare; .org is static HTML on Netlify.

Area	automationone.ca (current)	automationone.org (new)	Winner
Platform	WordPress + Yoast SEO	Static HTML on Netlify	New (simpler, faster ops)
Homepage HTML	~424 KB, ~0.45s (live)	~424 KB, ~0.54s (live)	Tie (both large HTML)
Products page	~1,235 KB, ~1.6s (live)	~279 KB, ~0.57s (live)	New (4x smaller)
Contact page	~350 KB (typical WP)	~123 KB, ~0.35s (live)	New
Canon hub (/canon)	~818 KB, ~1.2s	Lighter static pages	New
Homepage title	Keyword-heavy (Printing Vancouver...)	Brand-focused	New
H1 on homepage	0 H1 detected	1 H1	New
Meta + canonical + OG	Yes	Yes (all 100 pages)	Tie
JSON-LD (homepage)	3 blocks	LocalBusiness + FAQ on key pages	New (clearer)
Sitemap size	~198 products, 29 pages, 51 posts	99 static URLs	Old has more URLs today
robots.txt	WordPress (wp-admin rules)	Simple + sitemap	New
AEO	51 blog posts (long-tail)	FAQ + llms.txt + LocalBusiness	Old volume; new structure
Est. mobile PSI (perf)	45-55 on heavy pages	52-62 home; catalogue still heavy	New

Bottom line: Migrate to the new site on .ca as soon as redirects are mapped. The new build is already better for performance and structured SEO/AEO; preserve .ca URL equity with 301 redirects.

Live HTML document metrics (.org)

URL	Time	Size	PSI est.
/	0.54	424 KB	52-62
/products	0.57	279 KB	48-58
/contact	0.35	123 KB	58-68
/faq	0.57	121 KB	58-68
/about	0.47	142 KB	55-65
hero-printer-loop.mp4	-	6.7 MB	Hurts LCP if autoplay

*HTML transfer only; run PageSpeed Insights for full lab scores.

SEO & AEO on the New Site (Completed)

- Meta description on all 100 HTML pages
- Unique title + description on 35 Canon product pages
- rel=canonical, Open Graph, Twitter cards, og-image.png on every page
- robots.txt, sitemap.xml (99 URLs), llms.txt, favicons, webmanifest
- FAQPage JSON-LD (18 questions); LocalBusiness on home + contact
- automation-one-homepage-6.html: noindex; canonical to /
- Pretty URLs for main sections via netlify.toml (/products, /faq, etc.)

Remaining for perfect SEO/AEO

Priority	Action
P1	Submit sitemap after .ca cutover; verify Search Console on automationone.ca
P1	301 map every high-traffic WordPress URL to new paths
P2	Verify short URLs in Search Console after .ca cutover (implemented on .org)
P2	Product + BreadcrumbList JSON-LD on all SKU pages
P2	Decide blog strategy: redirect 51 posts vs migrate vs 410
P3	Organization sameAs (Google Business Profile); lastmod in sitemap

Fixing Long Product Page URLs

Physical files use long names such as **automation-one-canon-color-imagerunner-advance-dx-c3926i.html** (61 characters). There are ~70+ product pages with the automation-one-{brand}- prefix. Main pages already have short browser paths (/products, /faq); **product pages still show long .html URLs** in the address bar. **Status (June 2026):** Short paths are live on automationone.org via netlify.toml (/canon/..., /lexmark/..., /xerox/..., plus utility pages). Canonicals and sitemap should use short URLs; re-point to automationone.ca at cutover.

Recommended approach (safest)

- **Do not rename files on disk** (avoids breaking relative links and assets).
- Add **short public URLs** via Netlify 200 rewrites to existing .html files.
- Set canonical, og:url, and sitemap entries to the short URL only.
- Add 301 redirects from old long .html paths to short paths.
- Bulk-update internal hrefs in HTML (products grid, nav, breadcrumbs).

Target URL pattern

Today (example)	Target public URL
automation-one-canon-imagerunner-advance-dx-4945i.html	/canon/imagerunner-advance-dx-4945i
automation-one-lexmark-m5270.html	/lexmark/m5270
automation-one-xerox-altalink-c8170.html	/xerox/altalink-c8170
automation-one-network-installation-survey.html	/network-survey
automation-one-billable-confirmation.html	/billable-confirmation

Implementation steps

- Script: generate netlify.toml [[redirects]] for each automation-one-{brand}-.*.html
- Update apply-seo-fixes.py canonical base to https://automationone.ca + short paths
- Regenerate sitemap.xml with short URLs only
- Search Console URL inspection after cutover

Domain Migration Plan

Goal: Shut down WordPress on automationone.ca, serve the new static site on both .ca and .org, then eventually **301 redirect automationone.org to automationone.ca** so .ca is the permanent primary domain.

Phase 0 - Prep (1-2 weeks, .ca still on WordPress)

Priority	Action
P0	Export all URLs from https://automationone.ca/sitemap_index.xml
P0	Build redirects-ca.csv: old WordPress path to new path (301)
P0	Map top paths: /, /about/, /products/, /canon/, /contact/, /service/, /toner/, /faqs/
P0	Decide fate of 51 blog posts (redirect to /resources, /faq, or keep /blog/)
P0	Map 198 old WooCommerce product URLs to new SKU pages or discontinued hub
P0	Implement short product URLs on Netlify before cutover
P0	Set canonicals to https://automationone.ca/... before .org redirect

WordPress slug mismatches (need explicit 301)

Old (.ca)	New site path
/faqs/	/faq
/what-we-do-for-you/	/what-we-do
/idealmbm/	/ideal-mbm
/solutions/	/digital-solutions or /what-we-do (choose one)
Trailing slashes	Normalize with Netlify 301 rules

Phase 1 - Dual domain on Netlify (cutover week)

- Netlify: add custom domain automationone.ca + www.automationone.ca (same deploy as .org)
- Point .ca DNS to Netlify
- Deploy redirects-ca.csv / netlify.toml 301 rules for all old .ca URLs
- Google Search Console: add automationone.ca property; submit new sitemap
- Bing Webmaster: same
- Update GBP, email signatures, print ads to automationone.ca after live verification
- Optional: keep WordPress 48-72h for rollback only

Phase 2 - Stabilize (2-4 weeks)

- Monitor 404s in Netlify + Search Console weekly; add missing redirects
- Both domains serve same site; canonicals always point to https://automationone.ca
- GSC Change of address if Google still treats .org as primary

Phase 3 - .org redirects to .ca (when ready)

Add to netlify.toml (only after .ca redirects work and Search Console is clean):

```
[[redirects]] from = "https://automationone.org/*" to = "https://automationone.ca/:splat" status = 301 force = true
```

- Also 301 www.automationone.org to https://automationone.ca/
- Do not flip until: WP redirect map live, short URLs work, .ca indexed with low critical errors

Phase 4 - Decommission WordPress

- Cancel WP hosting after ~30 days stable .ca traffic
- Keep domain registration; DNS stays on Netlify

Suggested Timeline

Phase	Duration	Activities
Prep	Weeks 1-2	Redirect map, short URLs, blog/product decisions
Cutover	Week 3	.ca DNS to Netlify; 301s live; GSC submit
Stabilize	Weeks 4-7	Fix 404s; canonicals on .ca; monitor rankings
Final	Week 8+	.org 301 to .ca; shut down WordPress

Migration SEO / AEO checklist

Priority	Task
P0	301 every old .ca URL that had traffic (Analytics + GSC export)
P0	One canonical domain: https://automationone.ca everywhere
P0	New sitemap on .ca; resubmit in GSC
P1	Short public URLs for all product pages
P1	Product JSON-LD on SKU pages
P1	Blog strategy (redirect vs new /blog/)
P2	Performance sprint (hero video, shared CSS)
P2	Organization sameAs to Google Business Profile

Performance Roadmap (New Site)

Homepage: ~406 KB HTML (~191 KB inline CSS). Products: ~278 KB, 307 images (lazy-loading enabled). Hero video: 6.7 MB MP4.

Priority	Action
P1	PageSpeed Insights on /, /products, /contact; fix LCP and render-blocking fonts
P1	Hero: poster + preload=none; static image on mobile
P1	Self-host or subset Google Fonts
P2	Extract shared CSS to cached site.css
P2	Products: paginate or virtualize 307 catalogue images
P2	WebP/AVIF for large hero images

Estimated PageSpeed (mobile, homepage)

Category	Current est.	Target
Performance	52-62	85-92
Accessibility	85-90	92-96
Best Practices	90-96	96-100
SEO (Lighthouse)	92-98	98-100

Master Checklist

Area	Task	Status
New site	Meta + canonical + OG all pages	Done
New site	Canon unique titles (35 pages)	Done
New site	FAQPage + LocalBusiness JSON-LD	Done
New site	robots.txt + sitemap + llms.txt	Done
URLs	Short product URLs (/canon/..., /lexmark/...)	Done on .org
Migration	WordPress 301 redirect map	To do
Migration	.ca on Netlify (same deploy)	To do
Migration	GSC sitemap on .ca	To do
Migration	.org 301 to .ca	Later
Perf	PSI Performance 90+	To do
AEO	Product schema all SKUs	To do
Trust	GBP linked in schema	To do

Simple To-Do List (Start Here)

Think of this like moving houses: the **new house** is built (automationone.org on Netlify). Your **old address** (automationone.ca) still has the old furniture (WordPress). You need to put a sign on the old address that says "we moved here" (301 redirects), then tell Google the new address.

Step	What to do	Why
1	Open the new site	Visit https://automationone.org and click around. If something looks wrong, fix it before s
2	Make a list of old links	Export every URL from https://automationone.ca/sitemap_index.xml (like a phone book
3	Match old to new	For each old link, write which new page it should open (example: <code>/faqs/</code> goes to <code>/faq</code>). Sa
4	Add redirects in Netlify	Put those rules in <code>netlify.toml</code> so old <code>.ca</code> links automatically jump to the right new page.
5	Connect <code>.ca</code> to Netlify	In Netlify: add <code>automationone.ca</code> as a custom domain. At your domain registrar: point <code>.ca</code>
6	Tell Google	In Google Search Console: add <code>automationone.ca</code> , submit the new sitemap, watch for 4
7	Update the real world	Change Google Business Profile, email signatures, and printed stuff to say automationone
8	Turn off WordPress	Only after <code>.ca</code> works and redirects are good for ~30 days. Cancel old hosting.
9	Later: <code>.org</code> to <code>.ca</code>	When everything is calm, make <code>automationone.org</code> automatically forward to automationone

Already done for you: New site design updates pushed to Netlify; short product URLs on `.org`; SEO tags on all pages.
