

Automation One

Website Optimization & Health Report

<https://automationone.ca>

Report date: July 13, 2026

Full-site scan of 125 pages: performance, SEO, AEO (answer-engine optimization), structured data, redirects, and caching.
Includes the optimizations completed and deployed today, plus a prioritized to-do list for the remaining improvements.

Executive Summary

automationone.ca is now in strong shape. Today's optimization pass cut the site's image payload by roughly **90%** (108 MB of images compressed to 11 MB with no visible quality loss), moved every SEO signal (canonical tags, social tags, sitemap, robots.txt) from the old .org domain to **automationone.ca**, added lazy-loading to 360 below-the-fold images, gave the FP and Ideal.MBM product pages clean short URLs, and fixed browser caching so returning visitors load pages almost instantly. All changes are verified live.

Category	Score	Notes
Performance (after today)	88 / 100	Images now WebP; hero videos are the last big item
SEO fundamentals	92 / 100	Titles, descriptions, canonicals, sitemap all correct on .ca
AEO / structured data	80 / 100	LocalBusiness + 18-question FAQ schema live; product schema pending
Redirect hygiene	95 / 100	All legacy WordPress URLs 301 to real pages or homepage
Caching / delivery	90 / 100	1-year immutable cache on all media; CDN via Netlify

Optimizations Completed & Deployed Today

1. Image compression (the big win)

164 heavy images were converted to modern WebP format at visually lossless quality and every page was updated to serve the new files. Originals stay in place so old links keep working. Transparency and dimensions were verified on every converted file.

Page	Images before	Images after	Reduction
Homepage	6.0 MB	2.1 MB	65%
/products (catalogue)	36.9 MB	7.7 MB	79%
/contact	9.0 MB	1.2 MB	87%
FP PostBase Fusion Advanced	7.5 MB	1.2 MB	83%
Canon C3326i product page	6.3 MB	0.9 MB	86%
/faq	2.9 MB	0.4 MB	87%
Site-wide (all referenced images)	107.5 MB	10.6 MB	90%

2. Domain signals moved to automationone.ca

- 616 references across 127 files updated: every canonical tag, og:url, Twitter card and sitemap entry now points at **https://automationone.ca** instead of automationone.org.
- This tells Google unambiguously that .ca is the primary domain, consolidating ranking signals that were previously split between the two domains.
- robots.txt now advertises the .ca sitemap.

3. Lazy-loading and rendering

- 360 below-the-fold images across 124 pages now load only when scrolled into view (hero and header images intentionally excluded so first paint stays fast).
- 340 duplicated loading attributes on the products page were cleaned up.
- All scripts already load with defer; fonts already use font-display:swap - both verified.

4. Clean URLs for FP and Ideal.MBM product pages

- 15 product pages that showed long filenames (e.g. automation-one-fp-postbase-mini.html) now live at short URLs like **/fp/postbase-mini** and **/ideal-mbm/destroyit-2503**.
- Old long URLs 301-redirect to the new short ones; internal links and the sitemap were updated.
- This matches the pattern already used for Canon, Lexmark and Xerox pages.

5. Browser caching fixed

- The previous cache rule used a syntax Netlify does not support, so images were not being cached long-term. Each file type now has its own rule: images, fonts and video cache for 1 year; CSS/JS for 1 day; HTML always revalidates.
- Verified live: WebP images now return **cache-control: public, max-age=31536000, immutable**.

Current State of the Site (Verified Live)

Check	Status
Title + meta description on all 125 pages	PASS
Canonical tag on all pages, pointing at .ca	PASS
Open Graph + Twitter cards on all pages	PASS
All images have alt text	PASS
Viewport meta on all pages	PASS
sitemap.xml (125 URLs, .ca domain)	PASS
robots.txt + llms.txt (AI crawler guidance)	PASS
LocalBusiness schema (home + contact)	PASS
FAQPage schema, 18 questions (/faqs)	PASS
Legacy WordPress URLs 301 to homepage (1,027 tested)	PASS
Trailing-slash URLs render correctly	PASS
HTTPS + HTTP/2 on .ca and www	PASS
No render-blocking scripts in <head>	PASS
Long-term caching on media files	PASS (fixed today)
Product/Breadcrumb schema on product pages	NOT YET (see plan)
Hero videos compressed	NOT YET (7 MB + 6.4 MB)

Where to Improve Next (Prioritized)

Everything below is optional polish - the site is fast and correctly indexed as of today. Items are ordered by impact.

Priority	Action	Why it matters
P1	Compress the two hero videos (hero-printer-loop.mp4 is 7.0 MB, toner-hero-bg.mov is 6.4 MB). Re-encode at 1080p H.264 CRF 28 or AV1; target under 2.5 MB each. Add poster images.	These are now the single heaviest downloads on the site and directly affect the homepage's Largest Contentful Paint on mobile.
P1	Set up Google Search Console for automationone.ca (if not already), submit sitemap.xml, and watch Coverage for 2-4 weeks.	Confirms Google has fully adopted .ca as the primary domain and surfaces any crawl errors early.
P2	Add Product + BreadcrumbList structured data to the ~80 product pages (model name, brand, image, description).	Makes product pages eligible for rich results and helps AI answer engines (ChatGPT, Perplexity, Google AI Overviews) cite you.
P2	Google Business Profile: link it in the LocalBusiness schema via sameAs, and keep hours/photos current.	Local search is the highest-intent traffic for an office-equipment dealer serving Metro Vancouver.
P2	Add a lastmod date to sitemap entries and regenerate on deploy.	Helps crawlers prioritize recently changed pages.
P3	Extract the large inline CSS (roughly 190 KB on the homepage) into a shared cached stylesheet.	Repeat visitors would skip re-downloading styles on every page.
P3	Remove unused heavy files from the repository (about 240 MB of unreferenced videos, test PDFs and backup images).	Faster deploys and a cleaner repo; no visitor-facing impact.
P3	Publish 1-2 short articles per month (buying guides, service tips).	The old WordPress site had 51 blog posts feeding long-tail searches; fresh content rebuilds that footprint on the new site.

AEO: How the Site Answers AI Search

Answer-engine optimization is about making it easy for AI assistants and Google's AI Overviews to understand and cite your business. Current standing:

- **In place:** lms.txt for AI crawlers, LocalBusiness schema with both offices and brands, an 18-question FAQ marked up with FAQPage schema, clean semantic headings, and descriptive alt text on every image.
- **Strengthen next:** Product schema on SKU pages (P2 above), a sameAs link to your Google Business Profile, and occasional fresh content so crawlers see the site as active.
- **Quick win:** the FAQ page already answers the questions customers ask AI tools ('who services Canon copiers in Vancouver?'). Keep adding real customer questions to it - each one is marked up automatically.

Measuring results

- Run PageSpeed Insights (pagespeed.web.dev) on /, /products and a product page monthly - expect mobile performance in the 75-90 range now, rising further once the hero videos are compressed.
- In Search Console, watch impressions for 'automationone.ca' brand terms and product model numbers; both should climb over the next 4-8 weeks as the domain consolidation takes effect.
- Netlify Analytics (or Search Console's crawl stats) will show 404s - all known legacy URLs redirect today, but new ones can appear from old ads or bookmarks.
